

Drag and drop video from Explorer to your project in unity3d

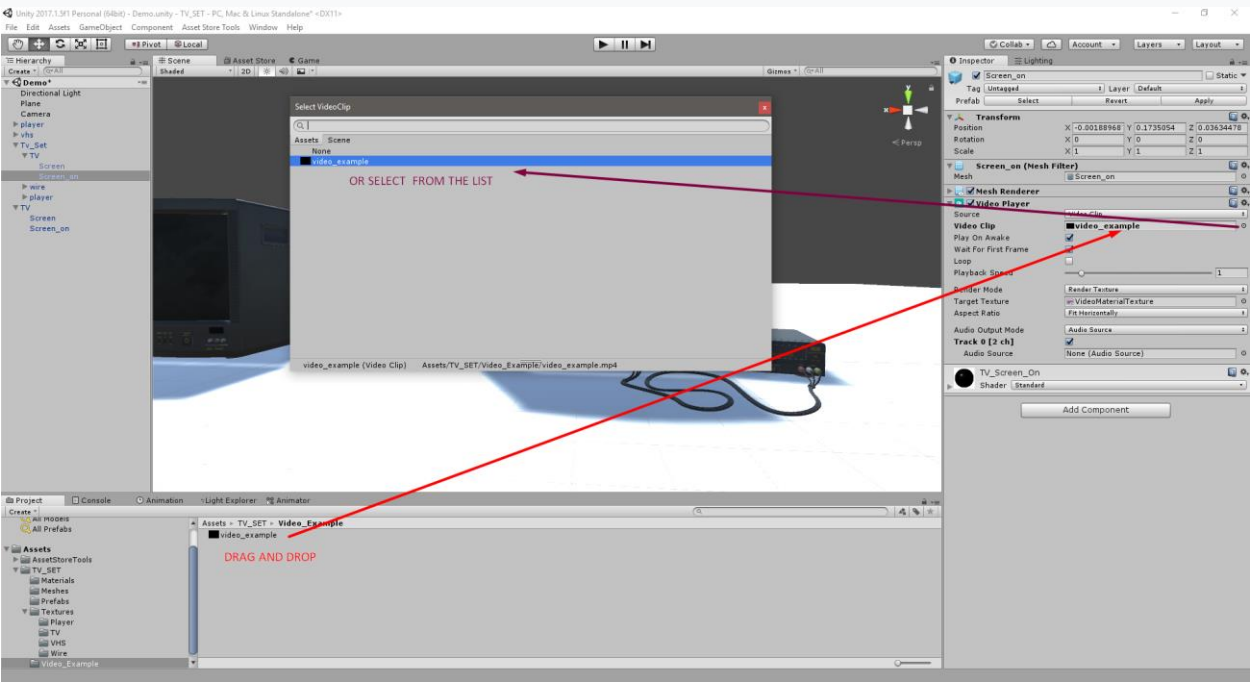

select the screen.

in the components, open the video clip tab

Drag the video file from the project folder into the video clip window. Or select your video from the list

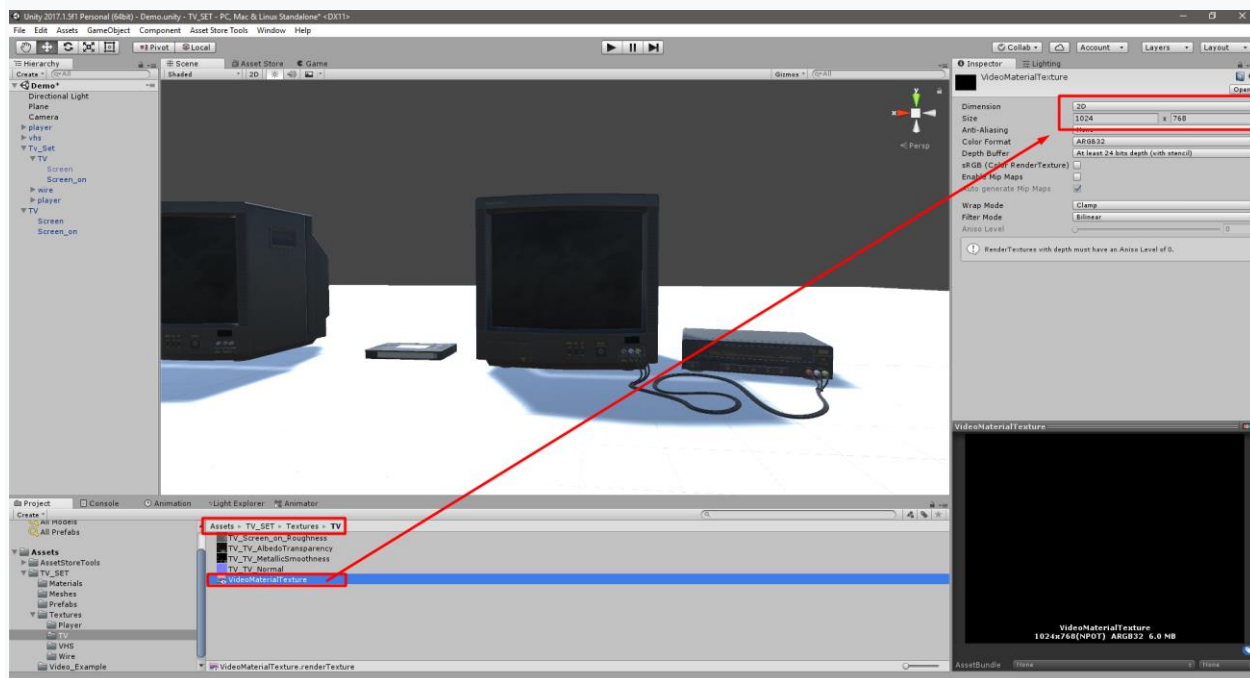

Done. Press the play button and your video will be displayed on the screen.

The screen has 4:3 aspect ratio. I recommend using a 4:3 aspect ratio video to avoid stretching the texture of the video.

Resolution can be changed. To do this, change the resolution of the render texture "VideoMaterialTexture", which is located in the folder TV_SET -> Textures -> TV.
